# 02.01. Site Identity

## Logo

You can change the logo, favicon and apple touch icon the [same way as for the dokuwiki template](#).

## Namespace Logo

If you enable `doLogoChangesByNamespace` in the template's configuration, Writr will use the closest logo as the site logo. Namespace Logos can be added using the media library. To show a different logo in a namespace, just make sure to add the custom `logo.png` in the namespace. This feature is recursive.

## Namespace URL

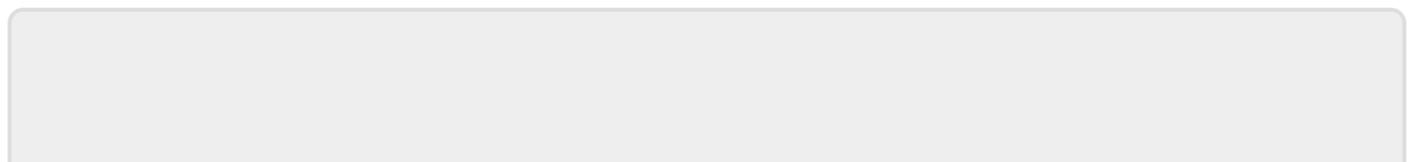

If you enable `doLogoLinkChangesByNamespace` in the template's configuration, Writr will set the logo's url to the same namespace it found the logo.

## Site Title

If you enable `doTitleChangesByNamespace` in the template's configuration, Writr will set the title found in the closest `nstitle.txt` page.

## Site Tagline

If you enable `doTaglineChangesByNamespace` in the template's configuration, Writr will set the title found in the closest `nstagline.txt` page.
